## Definitions for Properties of Mathematics

## Associative Property of Addition

When three or more numbers are added, the sum is the same regardless of the grouping of the addends. For example $(a+b)+c=a+(b+c)$

## Associative Property of Multiplication

When three or more numbers are multiplied, the product is the same regardless of the order of the multiplicands. For example $(a \times b) \times c=a \times(b \times c)$

## Commutative Property of Addition

When two numbers are added, the sum is the same regardless of the order of the addends. For example $\mathrm{a}+\mathrm{b}=\mathrm{b}+\mathrm{a}$

## Commutative Property of Multiplication

When two numbers are multiplied together, the product is the same regardless of the order of the multiplicands. For example $a \times b=b \times a$

## Distributive Property

The sum of two numbers times a third number is equal to the sum of each addend times the third number. For example $a \times(b+c)=a \times b+a \times c$

## Identity Property of Addition

The sum of any number and zero is the original number. For example $\mathrm{a}+0=\mathrm{a}$.

## Identity Property of Multiplication

The product of any number and one is that number. For example $\mathrm{a} \times 1=\mathrm{a}$.

## Additive Inverse of a Number

The additive inverse of a number, $a$ is -a so that $\mathrm{a}+\mathrm{a}=0$.

## Multiplicative Inverse of a Number

The multiplicative inverse of a number, $a$ is $\frac{1}{a}$ so that $a \times \frac{1}{a}=1$.

## Definitions for Properties of Mathematics

## Addition Property of Zero

Adding 0 to any number leaves it unchanged. For example $a+0=a$.

## Multiplication Property of Zero

Multiplying any number by 0 yields 0 . For example a $\times 0=0$.

## Property of Equality

The equals sign in an equation is like a scale: both sides, left and right, must be the same in order for the scale to stay in balance and the equation to be true.

## Property of Equality for Addition

Property of Equality for Addition says that if $a=b$, then $a+c=b+c$.
If you add the same number to both sides of an equation, the equation is still true.

## Property of Equality for Subtraction

Property of Equality for Subtraction says that if $a=b$, then $a-c=b-c$.
If you subtract the same number from both sides of an equation, the equation is still true.

## Property of Equality for Multiplication

Property of Equality for Multiplication says that if $a=b$, then $a \times c=b \times c$.
If you multiply the same number to both sides of an equation, the equation is still true.

## Property of Equality for Division

Property of Equality for Division says that if $a=b$, then $a / c=b / c$.
If you divide the same number to both sides of an equation, the equation is still true.

## Reflexive Property of Equality

Reflexive Property of Equality says that if $\mathrm{a}=\mathrm{a}$ : anything is congruent to itself.
The equals sign is like a mirror, and the image it "reflects" is the same as the original.

## Symmetric Property of Equality

Symmetric Property of Equality says that if $a=b$, then $b=a$.

## Transitive Property of Equality

Transitive Property of Equality says that if $a=b$ and $b=c$, then $a=c$.
